1 Orthogonality

Let $n, m \in \mathbb{N}$. The computation of the Fourier series is based on the integral identities

$$\begin{aligned}\int_{x=-\pi}^{\pi} \cos nx \cos mx \, dx &= \pi \delta_{nm} \\ \int_{x=-\pi}^{\pi} \sin nx \sin mx \, dx &= \pi \delta_{nm} \\ \int_{x=-\pi}^{\pi} \sin nx \cos mx \, dx &= 0\end{aligned}$$

2 Series expansion

The Fourier series of a real function $f(x)$ for $x \in [-\pi, \pi]$ is given by

$$f(x) = \frac{1}{2}a_0 + \sum_{k=1}^{\infty} a_k \cos kx + \sum_{k=1}^{\infty} b_k \sin kx$$

where

$$\begin{aligned}a_k &= \frac{1}{\pi} \int_{x=-\pi}^{\pi} f(x) \cos kx \, dx \\ b_k &= \frac{1}{\pi} \int_{x=-\pi}^{\pi} f(x) \sin kx \, dx\end{aligned}$$

3 Complex coefficients

The Fourier series of a real function $f(x)$ for $x \in [-\pi, \pi]$ is given by

$$f(x) = \sum_{k=-\infty}^{\infty} c_k e^{ikx}$$

where c_k are complex values for $k \in \mathbb{Z}$

$$c_k = \frac{1}{2\pi} \int_{x=-\pi}^{\pi} f(x) e^{-ikx} dx$$

This expansion is based on orthogonality relations

$$\begin{aligned} \langle \epsilon_n, \epsilon_m \rangle &= \delta_{nm} \\ \langle \epsilon_n, \epsilon_m \rangle &= \frac{1}{2\pi} \int_{x=-\pi}^{\pi} \epsilon_n^* \epsilon_m dx \end{aligned}$$

for the set of complex functions $\epsilon_k(z) = e^{ikz}, k \in \mathbb{Z}$
